

Document version: 0.0

By popular request, it is now finally (from ConvoProxy 1.4.0-Build 304 and ConvoProxy 1.2.4) possible to use FrankL's LoCoTest utility:

<http://frankl.luebecknet.de/frankl/stereoutils/loco.html>

with ConvoProxy for generating LoCo filters to use with ConvoProxy/ConvoFS.

For technical and other reasons, LoCoTest has to be installed in a "docker container", much the same way (but simpler), as one had to install ConvoProxy on DSM7, before the release of version 1.4.0-Build 304.

Please follow the detailed instructions below. Note that the Synology web utility for configuring containers, differs a bit from DSM 6.x to DSM 7.1, but the concepts are the same.

**If you have not already installed Docker on your Synology, please go to the Package Center section for the Synology web interface for your NAS and install it.**

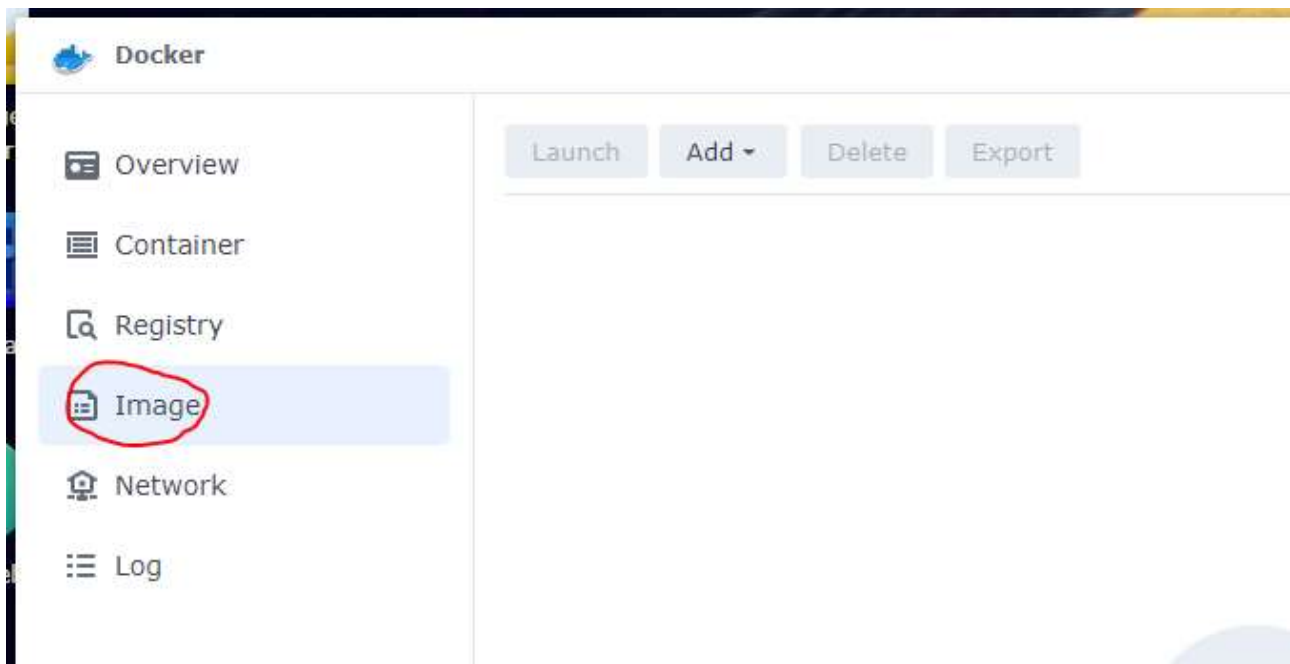

**Then:**

Search for the docker application from the DSM main screen:

Double-click the Docker icon. This will start the Docker application.

Click the *Image* icon:

Click *Add* and then *Add from URL*

Enter the text:

**convomichaelg/locotest**

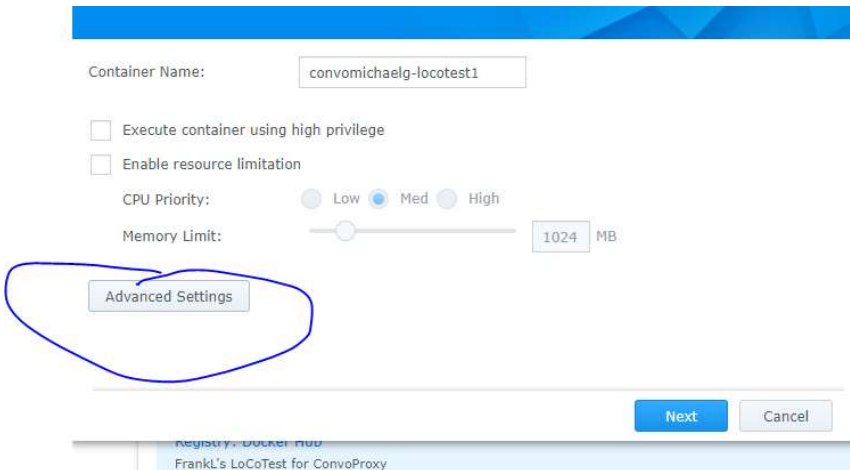

in the URL field and click *Add*. When newer versions are released, you may have to select the desired version (normally the newest one) and then click *Select*:

Wait for the download to complete (you will get a notification from DSM).

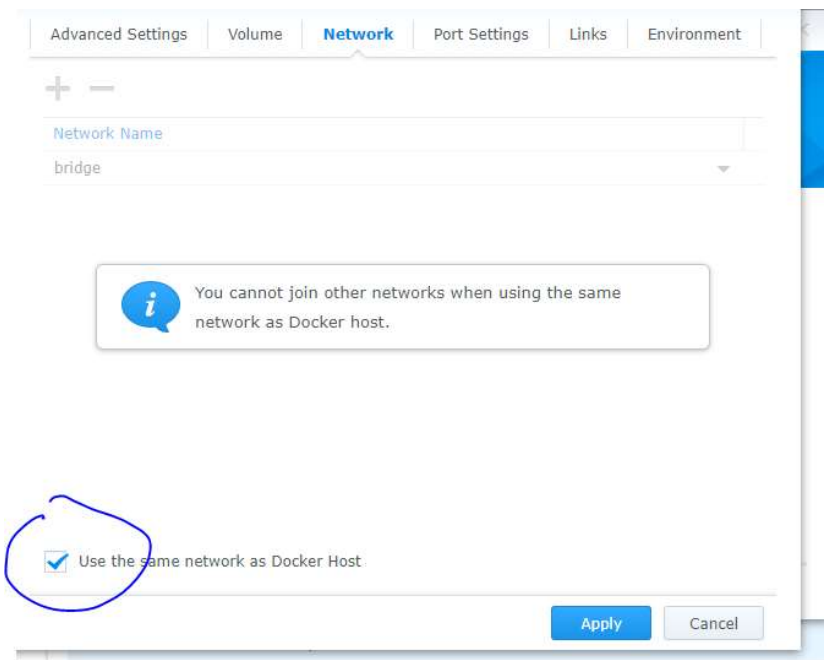

There is now a line for the locotest image:

Please double-click it. In the window that pops up, click *Advanced Settings*:

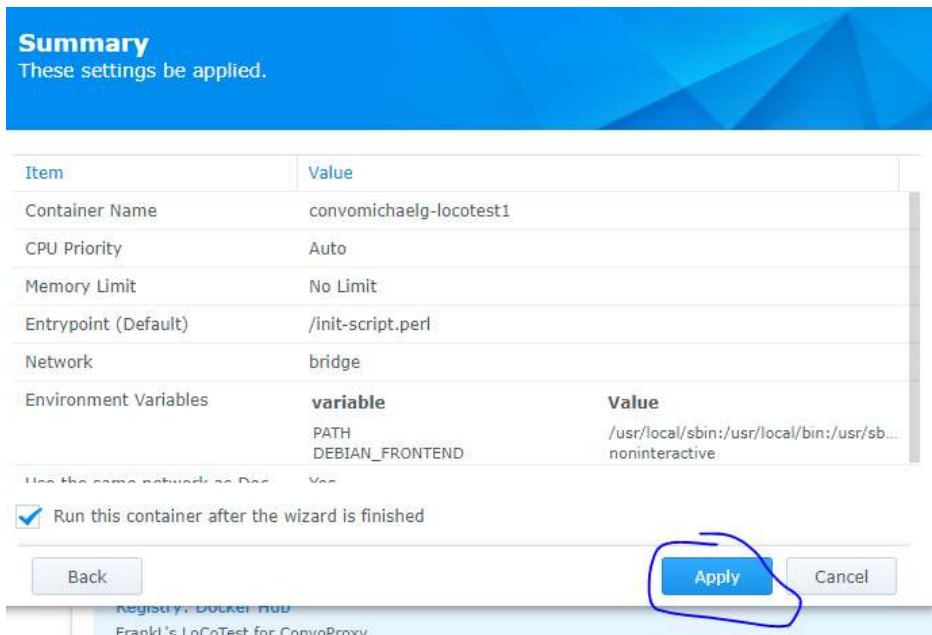

From there click the *Network* tab, then 'Use the same network as the docker host':

And then Apply.

This will return you to the previous windows. Click Next and Apply one more time:

Item	Value						
Container Name	convomichaelg-locotest1						
CPU Priority	Auto						
Memory Limit	No Limit						
Entrypoint (Default)	/init-script.perl						
Network	bridge						
Environment Variables	<table border="1"><thead><tr><th>variable</th><th>Value</th></tr></thead><tbody><tr><td>PATH</td><td>/usr/local/sbin:/usr/local/bin:/usr/sb...</td></tr><tr><td>DEBIAN_FRONTEND</td><td>noninteractive</td></tr></tbody></table>	variable	Value	PATH	/usr/local/sbin:/usr/local/bin:/usr/sb...	DEBIAN_FRONTEND	noninteractive
variable	Value						
PATH	/usr/local/sbin:/usr/local/bin:/usr/sb...						
DEBIAN_FRONTEND	noninteractive						
Use the same network as Docker	Yes						
<input checked="" type="checkbox"/> Run this container after the wizard is finished							

The LocoTest container will be created and start up. After a short while, you should be able to see it in the Container section.

## Post installations step(s):

Following the successful installation of LoCoTest in a docker container, please in your browser go to the following web address:

<http://name-or-IP-address-of-your-synology:4445/LoCoTest.flac>

*Name-or-IP-adress-of-you-synology* should the same as the one used for the administration interface of your box.

Accessing this address will prompt you to download a FLAC file. Please save it somewhere in your music collection where you can find it again. Then let your music server re-index.

You should now be all-set to use LoCoTest with ConvoProxy.

Play back the LoCoTest.flac file, with your streamer. If using folder view, please browse your way to it. If using an indexed view, look for the artist LoCoTest and the album "LoCoTest".

Then go to the web address

<http://name-or-IP-address-of-your-synology:4444>

This will lead you to the web interface of Frankl's LoCoTest program.

Each time you've changed a parameter in the LoCoTest interface, please restart play-back of the LoCoTest track. The way to do this depends on the control app you use.

## Restarting/Upgrading/removing an existing LocoTest installation

Find the LocoTest container in the Container application:

The slider to the right can be used to start/stop it..

If removing/upgrading LoCoTest, click it. After some seconds, this will stop the existing container and the slider will become shaded. Should you wish to start the container again, just click the slider, and it will start up again.

To upgrade/remove LoCoTest, mark the container using the mouse (without doubleclicking it). Then find and select the Delete function in the Action Menu:

Don't worry about the warning about data being lost. Click the red Delete button. The container will be gone, and you can install it again as described in the beginning of this document.
